Question taken from

https://github.com/gadepall/ncert/blob/main/linalg/optimization/gvv_ncert_opt.pdf–Q.no.2.11

1 QUESTION 2.11

Maximise

$$Z = x + y \quad (1.0.1)$$

subject to

$$x - y \leq -1 \quad (1.0.2)$$

$$x + y \leq 0 \quad (1.0.3)$$

$$x \geq 0, y \geq 0 \quad (1.0.4)$$

2 SOLUTION

$$Z - x - y = 0 \quad (2.0.1)$$

$$x - y + s_1 = -1 \quad (2.0.2)$$

$$x + y + s_2 = 0 \quad (2.0.3)$$

We will write the simplex tableau

$$\begin{pmatrix} x & y & s_1 & s_2 & c \\ 1 & -1 & 1 & 0 & -1 \\ 1 & 1 & 0 & 1 & 0 \\ -1 & -1 & 0 & 0 & 0 \end{pmatrix} \quad (2.0.4)$$

Keeping the pivot element as -1 , we will use gauss-jordan elimination.

$$\begin{pmatrix} x & y & s_1 & s_2 & c \\ 1 & -1 & 1 & 0 & -1 \\ 0 & 1 & -\frac{1}{2} & \frac{1}{2} & \frac{1}{2} \\ 0 & -2 & 1 & 0 & -1 \end{pmatrix} \quad (2.0.5)$$

Keeping the pivot element, we will use gauss-jordan elimination.

$$\begin{pmatrix} x & y & s_1 & s_2 & c \\ 1 & 0 & \frac{1}{2} & 0 & -\frac{1}{2} \\ 0 & 1 & -\frac{1}{2} & 0 & \frac{1}{2} \\ 0 & 0 & 0 & 1 & 0 \end{pmatrix} \quad (2.0.6)$$

We have determined the optimal solution to be:

$$(x, y, s_1, s_2) = \left(-\frac{1}{2}, \frac{1}{2}, 0, 0 \right) \quad (2.0.7)$$

$$Z = x + y \quad (2.0.8)$$

$$Z = -\frac{1}{2} + \frac{1}{2} \quad (2.0.9)$$

$$Z = 0 \quad (2.0.10)$$

The given problem can be expressed in general as matrix inequality as:

$$\max_{\mathbf{x}} \mathbf{c}^T \mathbf{x} \quad (2.0.11)$$

$$s.t. \quad \mathbf{A} \mathbf{x} \leq \mathbf{b}, \quad (2.0.12)$$

$$\mathbf{x} \geq \mathbf{0} \quad (2.0.13)$$

$$\mathbf{y} \geq \mathbf{0} \quad (2.0.14)$$

where

$$\mathbf{c} = \begin{pmatrix} -1 \\ -1 \end{pmatrix} \quad (2.0.15)$$

$$\mathbf{A} = \begin{pmatrix} 1 & -1 \\ 1 & 1 \end{pmatrix} \quad (2.0.16)$$

$$\mathbf{b} = \begin{pmatrix} -1 \\ 0 \end{pmatrix} \quad (2.0.17)$$

and can be solved using *cvxpy*. Hence,

$$\mathbf{x} = \begin{pmatrix} -0.5 \\ 0.5 \end{pmatrix}, Z = 0 \quad (2.0.18)$$
